

# Annual Flower Seeds

For your convenience, we have divided our catalog into sections - Annuals, Perennials, Climbers, Vegetables, and Plug and Plant Material.

In reviewing our catalog, you will find a line of information below each variety. We have listed the number of seeds per ounce, the best soil temperature for germination, and germination time. When seeding by hand, sow seed in indented rows (in the "valleys"). Cover lightly if required, only to the thickness of the seed. This will keep moisture levels high around the seed and avoid drying out.

Through our years of experience, we have added "grower tips" that we feel you will find useful. In evaluating the entire germination and growing process, may we stress the importance of purchasing good seed, using sterilized media, and maintaining the proper soil temperature. All too often, ideal conditions and soil temperature are completely defeated by the use of cold water on seed flats and seedlings. PLEASE avoid chilling the flats and checking growth with the use of cold water.

In storing seeds - use a cool, dry place, never in areas of high humidity.

**DRACAENA**

**7,500 sds/oz 80° 3-5 weeks**

Scarification can be an important process prior to sowing. It can be very helpful in avoiding erratic and poor germination. The following should be performed prior to sowing, up to 1 week prior. Rub seed in hands until black coat comes off. This is usually accomplished with 6-7 strokes. The objective is to partially remove the black coat on the seed. This can also be performed by rubbing the seed over a metal screen. You should see some black coating on the table or floor. The objective is to break the black seed coat, NOT damage the seed. You should not need to rub it more than 6-7 times with your hands. For best results, we suggest soaking the seed in warm water for 5-7 days before sowing. Change water daily to avoid fermentation. Sow seeds and cover with 1/16 in. of media, alternate soil temperature of 85° days and 70° nights.

7,000 sds/oz 70° 20 days

Outstanding cut flower, blooms July-September. Will flower the first year from seed. Will attract butterflies, hummingbirds, and songbirds all season as well as help repel deer. Praised for their cheerful brightly colored flowers, coneflowers are a mainstay in today's garden. Be sure to leave some spent blooms on the plants in the fall because their seeds provide winter food for finches and other birds. Echinacea is best known for its ability to stimulate the body's immune system, especially against colds, flu and other acute infections. Today, science uses this herb to treat burns, eczema, cold sores, herpes, and arthritis.

## IMPATIENS DMR

**DOWNY MILDEW RESISTANCE !** These two series have been bred to be HIGHLY downy mildew resistant. Now it is time to take back the shade!

Since 2011, Impatiens downy mildew (IDM) has decimated Impatiens beds across the globe. IDM is caused by a host-specific water mold, *Plasmopara obducens*. When present, and environmental conditions are met (high humidity and cool night temperatures), the disease can spread rapidly, resulting in flower drop and eventually plant collapse – a loss of impatiens in your garden! Both airborne and overwintering spores meant this popular shade garden flower couldn't be grown with confidence because of the threat of disease.

At first, gardeners planted alternatives for shade colour: Begonia, Torenia, Coleus, as well as New Guinea Impatiens, which are not susceptible to the disease. But nothing could take the place of the traditional Impatiens walleriana garden fill, color range and performance.

What is HIGH RESISTANCE? The plant highly restricts the growth and/or development of the pathogen/damage it causes under normal pressure when compared to susceptible varieties under similar environmental conditions and pressures.

## BEACON SERIES

10-12 in. - 45,000 S. (F-1 Hybrid). No-Risk Colour for the Garden! Fill your gardens once again with bright, long-lasting color without the risk of disease! Breeder tests have proven Beacon's high resistance to Impatiens downy mildew from sowing all the way through the gardening season. It has the same plant structure, flowering time, flower size and culture as traditional garden impatiens. Now plant shade landscapes with confidence! Ideal in packs, pots, baskets and window boxes. More info available at [www.beaconimpatiens.com](http://www.beaconimpatiens.com) Weeks to flower: 7-9 for packs. COATED SEED.

30,000 - 50,000 sds/oz 72°-76° 5-8 days

7-8 weeks sowing to flower in packs. The number one bedding plant in North America, Impatiens offer a wide array of brilliant colors and thrive with minimum care. Blooms continuously from mid-summer until frost. A most valuable bedding plant for shady places. As a pot plant they bloom the year round. Impatiens are easily grown from seed.

For satisfactory germination, soil temperature of 72°-76° must be maintained at all times with an even moisture level. Do not cover seeds with mix or media, light induces a more even and higher germination level. Use bottom heat if possible. (Keep seed flats out of direct sunlight.)

Due to the breeder's development efforts, we can assure you of a high germination percentage of at least 92% on all Super Elfin, Accent and Xtreme varieties.

8,000 sds/oz 55° 21 days

For the best germination, cover seeds lightly after sowing. Darkness will help germination. Freeze seed 3-5 days before sowing.

Sow outdoors in late fall or in early spring as soon as the ground can be worked. 2 lbs. seed will grown an acre, 1 oz. a row 600-700 ft. For growing under glass, space 10 in. x 10 in. on raised benches and maintain a night temperature of not over 50°. Seed does not germinate well in hot weather. If a sowing must be made in summer heat, chill it for several days in a refrigerator (45°-50°) or set the seed flat under a bench or in a cool shed. It takes from 2-3 weeks to germinate, sometimes longer. Following varieties are the best for growing under glass and outdoor cultivation. ## LISIANTHUS, DOUBLE

### Eustoma

**600,000 sds/oz 68°-75° 10 days**

Lisianthus is sensitive to temperatures in excess of 75°. For the best germination, cover pelleted seed lightly with a thin layer of medium grade vermiculite. High temperatures trigger rosetting, an induced resting stage. Seedlings are most sensitive to rosetting until two sets of true leaves have formed. Seedlings that are affected by rosetting will have delayed or inhibited flower stem production. Transplant when 4-8 true leaves appear, keep shaded until they have rooted. Lisianthus is a slow growing crop in the seedling stage. It is important to keep seedlings actively growing to avoid inhibiting the flower stem length. Proper control of temperature, light and fertilizer are very important in producing a great crop of lisianthus.

Plant only in sterilized soil and benches to protect against root rot. After sowing seed, cover lightly with vermiculite. Light will help germination. For selectable varieties, double-flowering plants may be selected from single-flowering types by exposing seedlings with fully expanded cotyledons to 41°F for approximately 4-7 days. At this point, seedlings of double-flowering plants will appear a pale green, white singles remain dark green. After removal from cold treatment, double-flowering seedlings will appear yellow and chlorotic within 1-2 days, while single-flowering seedlings remain robust and green. ## VINCA

### Periwinkle, *Catharanthus roseus*

**21,000 sds/oz 75°-80° 15 days**

For the best germination, several growers have suggested that freezing the seed for 5 days before sowing will help germination. Sow seed on sterilized media, cover seed lightly with soil, darkness will help germination. Maintain 75°-80° soil temperature, use bottom heat and keep the surface moist. Once established, grow at 65°. They are very sensitive to temperatures below 65°, and overwatering – this will affect the growth and flowering time and give disappointing results. Do not pinch as flowering could be delayed 3-4 weeks.

Water Vinca sparingly and let them dry out before watering again, this practice develops a proper root structure and prevents root rot. Always allow the plants to get established before applying fertilizer, then apply only at low rates. Low temperatures below 65° will cause yellowing of foliage, stunted growth, and a poor quality plant.

**TIGER EYE SERIES**

4-8 in - 35,400 S. (F-1 Hybrid). An absolute must for any Halloween promotion. Unique, no freak of nature, rather the result of an impressive breeding program. Flowers are 1 1/2 in. and have black vein-like loops radiating from a black center. Earlier flowering, much improved plant habit and better seed quality means it can be grown alongside mainstream Viola and Pansy crops. Create an eye-catching display in borders or containers. Culinary note: Some parts of these flowers are edible. The crystallised petals are great decorations for cakes and cookies or they can be added straight to green salads for an injection of color. ## BASIL

**13,000-28,000 sds/oz 70° 7-10 days**

Will grow in rich, moist soil, but well drained with a pH of 6 to 7. Likes warm weather and cannot withstand frost, as it will show cold damage such as blackened leaves when exposed to cool temperatures below 50°. If flowers appear simply pinch them to keep the plant producing tasty leaves. Because basil is harvested continually for lots of leaves it needs a little fertilizer. When planting, add a coated, slow release fertilizer such as 19-19-19 at the rate recommended or work plenty of organic nutrients from compost, blood meal or cottonseed meal into the soil. Keep moist, not wet, dry soil stunts its growth. Water on the leaves can damage them so it is best to water the base of the plant or use drip irrigation.
